CORE: DATA AND DISCOVERY (CDAD-UH)

CDAD-UH 1001Q Data (4 Credits)
Typically offered Spring
Data are everywhere. We have massive datasets keeping track of humanity’s everyday minutiae from babies born to calories consumed, friends made to crimes committed. How can we use these data to make useful predictions and gain insights into ourselves and humanity in general? This course introduces the basics of learning from data and covers topics such as wrangling, exploration, analysis, prediction, and storytelling through data visualization.

CDAD-UH 1002Q Space (4 Credits)
Typically offered Fall
What’s out there? For centuries, curious astronomers peered up into the night sky and saw stars, planets, and the occasional comet. Nowadays, astronomers have a suite of tools at their disposal to observe objects in space and help to answer the fundamental questions about the intricate workings of the Universe. From arrays of radio dishes spanning continents to gamma-ray detectors on satellites orbiting the Earth, astronomy is now truly Multi-Wavelength. This course is a journey of discovery, where students peer at objects such as quasars, stellar nurseries, galaxy clusters, supernovae, black holes, extrasolar planets, neutron stars, molecular clouds and gamma-ray bursts through various telescopes. Research and presentation will form a core part of the course, and experimental and quantitative methods will be brought to bear on our understanding of other worlds. How these results can be communicated to the scientific community and the public will be discussed, along with the relevance to society, including spin-off technologies. Data & Discovery Core courses develop the ability to use experimental and quantitative methods to understand the world - and in this course - other worlds!

CDAD-UH 1004E Microbes (4 Credits)
Typically offered occasionally
Microbes are the most abundant organisms on Earth. They practically exist in every environment on our planet and play major roles in defining our atmospheric composition, sustaining the food webs that feed us and significantly influencing our health. Yet, microbes are diverse; they vary in size from 0.2 micrometers (1/300th diameter of a human hair) to a few millimeters. Some microbes are loners while others live in communities that talk to each other and coordinate behavior. The class will introduce students to microbes by examining their importance, ecology and diversity. The class will take students on a journey of how early microbiologists classified microbes, isolated and cultured them and how today DNA sequencing has revolutionized the way scientists classify microbes. Throughout the course, students will isolate samples to image and culture microbes and isolate their DNA from around the NYU Abu Dhabi campus and the emirate of Abu Dhabi. DNA samples will be sequenced using portable DNA sequencing technology (MinION technology), which generates data rapidly.

CDAD-UH 1005EJQ Forensic Science: Guilty or Not Guilty? (4 Credits)
Typically offered Summer and January terms
“Every contact leaves a trace.” This phrase, coined by the pioneer of forensic science Edmond Locard, is the starting point of all forensic investigations. Scientific measurements are used to discover traces left at the crime scene and connect them to a person, object, or place. But what is it about science that allows us to make these connections? And how are facts determined by scientific measurements different from those recorded during an interrogation? Does the word “fact” carry the same meaning in the legal system as it does to you or to an experienced scientist? In this course, students explore these questions while analyzing samples left at a crime scene using biological, chemical, and physical laboratory techniques used in forensics. Exploring the underlying scientific principles and analyzing adjudicated cases, they discuss the capabilities and limitations of forensics, how it relates to the criminal justice system, and its impact on society.

CDAD-UH 1007EQ The Mind (4 Credits)
Typically offered Fall
This course explores definitions and theories of the mind and how it may work. Students will learn how philosophers, psychologists, computer scientists, and neuroscientists have studied the mind and will consider several demanding but stimulating questions about thought, memory, and behavior. Readings and discussions will review the historical and scientific developments that led to contemporary understandings of the mind and the challenges and answers that these views pose to our common-sense understanding of, for instance, the unconscious mind, the irrational mind, and the subjective nature of memories.

CDAD-UH 1008EQ Seven Wonders of the Invisible World (4 Credits)
Typically offered Fall and Spring
"In the year of 1657 I discovered very small living creatures in rain water." This quote is attributed to Anton van Leeuwenhoek, a Dutch merchant whose skillful use of glass lenses allowed him to peer into a world of microorganisms that would otherwise be invisible to the naked eye. His careful observations gave way to advances in microscopy that have allowed scientists to observe detailed structures of plants, viruses invading cells, intricate crystal lattices, and the seemingly chaotic motion of small particles. In this course, microscopy is explored, first by examining the fundamental optical systems used to magnify objects, and eventually by using sophisticated microscopes to make observations. We explore seven wonders of the invisible world - natural animate and inanimate phenomena that include micro-animals, plant and animal cells, bacteria and viruses, fungi, proteins, and naturally occurring crystals.

CDAD-UH 1009EJQ Behavior (4 Credits)
Typically offered January term
Why we behave in a particular way is one of the most fascinating and complex questions and one that we often cannot even explain to ourselves. What drives behavior? How can behavior be measured? And can behavior be changed? This course will examine behavior from the viewpoints of biology, neuroscience, psychology, and economics. We will emphasize designing and interpreting experiments that measure behavior in both animals and humans. We will discuss topics as diverse as circadian rhythms, memory and anxiety and examine how being part of a group affects behavior. We will also measure animal and human behavior and learn how to analyze and present quantitative data.
Grading: Ugrad Abu Dhabi Graded
Repeatable for additional credit: No
- Bulletin Categories: Core: Data Discovery

CDAD-UH 1010EQ Diversity (4 Credits)
Typically offered Fall
Diversity is everywhere. We see it in the 8+ billion human beings and the 4,700 languages they speak. It is present at every scale from the cell types making up complex organisms to the different species present in an ecosystem. It is even present in the opinions people have on diversity itself. Talking about the worldwide loss of biodiversity and languages or about present and past human diversity thus requires clarifying and discussing important concepts. Understanding patterns of genetic diversity within species to unravel their evolutionary history requires a critical analysis of patterns and processes. This has consequences for our understanding of human evolution but also for our understanding of endangered species. During this course we will need a common language to clarify and discuss important concepts (what is diversity, how can it be quantified, how is it represented across scales, but also what is science, is it just a narrative among others, diverse narratives, can the idea of model and consistency be useful to identify scientific from other types of discourses?)

**CDAD-UH 1013EQ  Stem Cells: Immortality and Regeneration (4 Credits)**  
*Typically offered Summer term*

dxStem cell biology and gene-editing techniques are two technologies that when combined are transforming medical care. They are undoubtedly an integral component of future treatments. At the same time, these technologies raise novel ethical issues challenging the definition of what we consider human life at its core. Through lectures, practical examples, and discussions we will try to find answers to these questions and more: What are stem cells? How are they "made" in laboratories? Can they cure people? Are current stem cell technologies safe? Can we clone people to harvest organs? Can we generate animal-human chimeras to harvest organs and cells? What are the ethical concerns when using stem cells in combination with gene editing technologies? These questions are key to understand stem cell - and gene editing-based therapies, their practical applications, and their safety and ethical considerations. We will read and discuss the literature describing milestones in stem cell research and genome editing and gain practical training in growing and differentiating embryonic stem cells. We will also review the ethical and political issues regarding the use of stem cells.

**CDAD-UH 1016EQ  Where the City Meets the Sea: Studies in Coastal Urban Environments (4 Credits)**  
*Typically offered Fall and Spring*

Over half of the human population lives within 100 km of a coast and coastlines contain more than two-thirds of the world's largest cities. As a result, the world's natural coastal environments have been substantially modified to suit human needs. This course uses the built and natural environments of coastal cities as laboratories to examine the environmental and ecological implications of urban development in coastal areas. Using data from multiple coastal cities, student teams use field-based studies and Geographic Information System (GIS) data to examine patterns and processes operating in coastal cities. This course uses the local terrestrial, marine, and built environments as a laboratory to address these issues, and team projects requiring field work form a core component of the learning experience. As part of the NYU Global Network University this course is being offered simultaneously in several NYU sites globally and students are collaborating extensively with students from their sister campuses through the duration of this course.

**CDAD-UH 1017EQ  Symmetry (4 Credits)**  
*Typically offered Spring*

Symmetries are ubiquitous in nature and permeate the arts. Beginning with both intuitive definitions and more formal mathematical descriptions, the course will explore the symmetries in the subatomic constituents of matter and their interactions, larger-scale chemical and biological compounds, and the macroscopic natural world. Students will explore ways in which the human psyche is primed to find symmetry beautiful and examine the symmetries that underlie artistic creations, from geometrical patterns in artwork, to rhythm and chord progression in musical composition, and meter and rhyme in poetry. After a thorough study of symmetry, the course will end with a discussion of asymmetries and broken symmetries in nature and aesthetics.

**CDAD-UH 1019Q  Heat and the Universe (4 Credits)**  
*Typically offered Spring*

The study of temperature and of heat, as formulated in the laws of thermodynamics, will be used as a unifying guide to examine a variety of phenomena in our natural world. In the physical world, course topics will encompass the cooling of the Universe in its early minutes as well as the dramatic expansion in the first seconds after the Big Bang and the role that temperature fluctuations have played in the Earth's history. In the animal world, the course covers the surprising discovery of heat-loving bacteria and the techniques mammals, including humans, have adopted for temperature regulation. Readings will include materials from various scientific realms such as cosmology, biology, and geology.

CDAD-UH 1020EJQ Challenges in Global Health (4 Credits)
Typically offered January term
Why are clean water, sanitation and hygiene (WASH) programs still failing in so many places in the world? In this course we tackle this question as a lens through which to investigate challenges in global health. Addressing global health issues requires a robust understanding of the history of health development and reasons behind successes and failures of public health initiatives in the developing world. Together, we will explore the social, political, and biological bases of primary public health challenges in the WASH sector. Case studies will center on Nepal from the perspective of applied medical anthropology. Using data from an active WASH program in Nepal, students will work in teams on basic data manipulation, analysis, and visualization and then present findings virtually to a group of project planners, NGO staff, and other stakeholders interested in project evaluation in Nepal. NOTE: Pending feasible international travel conditions, this course will include a seminar in Nepal.

CDAD-UH 1022JQ Sustainable Development (4 Credits)
Typically offered January term
Sustainable development is the most significant global challenge of our time. In fact, humanity’s survival as we know it depends on finding ways to maintain societal progress while living healthily within the carrying capacity of the Earth. This course introduces students to the concepts, literature, scientific methods, data, and practices of sustainable development both globally and locally. We start with history and global observations, and gradually work our way to regional and local issues involving people, industries, ecosystems, and governments. From the environmental realm, topics covered include the use of energy, water, and other resources, emissions, climate change, and human and ecological health impacts. We review the economic implications of pathways to a sustainable future. In all our discussions, societal impacts such as equity, wealth, and justice are considered, and discovery of data needs and analysis are explored.

CDAD-UH 1024Q Reading Like a Computer (4 Credits)
Typically offered Fall
How do computers "read" text, and how can computer-assisted analysis of texts give us new access to information about ourselves and the cultural legacies we have inherited? This course explores quantitative methods for discovering and analyzing diverse texts of the human record. It also offers a glimpse into possible futures of reading. Students will both discuss, and put into practice, forms of computer-assisted textual analysis that have revolutionized research in humanities and social science fields in recent years. They will also take a critical look at the "ubiquitous analytics" and the "ubiquitous virtuality" of everyday life. By engaging with the idea of data in the humanities, the course encourages students to reconsider our common-place assumptions about how reading works. Course materials, discussions, and classroom exercises will push students to examine how basic ideas about a text such as author, subject, setting, character or even style might look different when a non-human is involved in the interpretation. The course assumes no prior computer or coding skills, but a willingness to explore new technologies is essential for success.

CDAD-UH 1026EJQ  Water, Energy, Food Nexus  (4 Credits)
Typically offered Spring
Billions of people on earth lack adequate access to water, food, and
energy. What might be gained by recognizing the interdependencies that
exist between these resources? It is well known that water is fundamental
to agriculture and to the entire agro-food supply chain. Moreover, it
is clear that energy is required to produce and distribute water and
food: to pump water, to power irrigation machinery, and to process and
transport agricultural goods. But a global society requires industry and
policymakers to take even broader views. For instance, how are water
security, energy security, and food security linked, so that actions in
one area will likely have impacts in one or both of the others? How will
population growth, economic development, and climate change affect
international efforts to eradicate poverty? Additionally, what roles might
renewable energy technologies play in providing access to cost-effective,
secure, and sustainable energy supplies? Students will approach these
questions through multidisciplinary lenses and cultivate the skills
required to address the social, economic, and environmental challenges
posed by the water-energy-food nexus.

CDAD-UH 1027E  5000 Years of Notable Lives: Measuring Influence
across Cultures  (4 Credits)
Typically offered Fall
In the world of Big Data, information is everywhere; for example,
Wikipedia biographies collect information for millions of individuals,
translated into more than 200 languages for the most famous. The
information is, however, not easily accessible for a quantitative analysis.
The class will collect and analyze Wikipedia biographical information
of one million biographies from 3000 BCE to now, with data scraping tools
and text recognition techniques. It will extend the database (currently 1.9
million pages just in European languages) to terra incognita: based on
students’ skills, editions in Arabic, Chinese, Japanese, Persian, Russian,
Polish, Dutch, Magyar, Turkish, Ukrainian, etc. will be added to the current
stock of knowledge. Students will learn tools to scrape the internet and
collect information (Python); to transform text into a proper database; to
check and minimize errors; to analyze the reciprocal causation relations
between the concentration of scientists, artists, politicians on the one
hand, and the economic and political expansion of large cities on the
other, using basic econometric techniques.

CDAD-UH 1032Q  Stability  (4 Credits)
Typically offered Spring
What makes a system stable or unstable? How does a lack of stability
translate into chaos or turbulence? Every new device, experiment,
or idea, requires a check for system stability. Important in science,
ingeneration, politics, economics, and daily life, understanding stability
enables predictability and control. In the late nineteenth century,
philosophers, physicists, and mechanical engineers laid the foundations
of hydrodynamic stability, the field which analyzes the stability and onset
of instability of fluid flows. How have these breakthroughs helped us
to determine whether a given flow is stable or unstable, or to describe
how possible instabilities can cause turbulence? And how might insights
drawn from such fields offer insight into other areas of our lives, from
monetary or political systems to bridges to interpersonal relationships?
Grading: Ugrd Abu Dhabi Graded
Repeatable for additional credit: No
• Bulletin Categories: Core: Data Discovery
CDAD-UH 1033EQ  Data and Human Space  (4 Credits)
Typically offered Fall
Societies have traditionally used maps to represent, even construct,
the spaces in which we live as well as the territories over which we
assert control. But what has become of the map in the (post-)digital age?
Has our relationship to human space changed in our data-rich world?
Are we unknowingly map-makers by virtue of walking around with our
devices? This course explores the specific role that technology can play
in our understanding of both historical and contemporary map making.
Through regional and global examples of urban culture mapping, the
course’s focus on data discovery extends beyond working with official
data to creating our own data within familiar environments. In addition
to seminar discussion of readings and audiovisual materials, the course
will host guest speakers. It also has a lab component with two main
assignments. First, we focus on the larger Arabian Gulf region through
the eyes of historical cartographers and colonial geographers. Second,
we will turn to the city of Abu Dhabi itself to see how (and why) we might
map some of its spaces of human culture using simple technology. The
course assumes no prior computer skills.

CDAD-UH 1034Q  Numbers, Models, and Chaos (4 Credits)
Typically offered Spring

The hallmark of a successful scientific theory is its ability to predict the outcome of experiments. Yet the last century’s most shocking scientific development is the mathematical theory of chaos, with the subsequent realization that predictability has intrinsic limits. Such limits may have no practical importance (as in many engineering problems). Sometimes they shape an entire branch of science (as in meteorology). This course provides a challenging, but accessible, way to understand predictability’s limits, while still appreciating the bedazzling richness of phenomena that only theories which face these limits can possibly describe. The course brings together, in a cohesive whole, ideas about numbers and infinities; the inner working of computing machines; nuances and concessions occurring in model-building; the meaning of randomness and of deterministic. Students will participate in the construction of mathematical models (mostly inspired by population biology) under the form of iterated maps, and interact with simple computer simulations of those models to illustrate key concepts of nonlinear dynamics: stability, limit cycles, attractors, and predictability.

CDAD-UH 1037 Cyberwarfare (4 Credits)
Typically offered Spring

Einstein once said, “I know not with what weapons World War III will be fought, but World War IV will be fought with sticks and stones.” The answer to part one of his statement is here: World War III will likely be a cyber war. Election hacking, power grid cyberattacks, troll farms, fake news, ransomware, and other terms have entered our daily vocabularies. How has the threat of cyber war transformed our definitions of privacy and security, on individual, national, and international planes? We will dive in with specific case studies, such as power grid cyberattacks, and we will perform cyber tabletop exercises. The first half of the course establishes the technical foundations needed for understanding cyberspace; the second half approaches the problem from different angles, attempting to understand the repercussions of technological, legislative, and political changes.

CDAD-UH 1039EQ Search (4 Credits)
Typically offered Spring

How do we find what we’re looking for? How do we know when we’ve found it? If we can’t tell the future, how do we make choices that impact the rest of our lives, such as finding a life partner, a fulfilling career, or even a good Core course? This course examines the nature and implications of such search processes. Questions addressed include why marital selection (when and whom to marry) has changed so much over time. Why do more women than men now go to college in some parts of the world? What does the data suggest explains these major societal changes? Students will be tasked with obtaining country-level evidence on how changing legislation in different countries is observed to affect societal outcomes. Students will not only learn the nature of causal inference in data, but will better understand how and why society is changing. Additional topics include the search for knowledge (scientific method and causality), navigation (the search for home [and time dilation with GPS]), returns to matching (insect swarms and Tinder) and even shopping at the carpet souk.

CDAD-UH 1041EQ Decisions and the Brain (4 Credits)
Typically offered Spring

Where do errors come from? How can we make better decisions? Should intuition be trusted? Can we nudge others to make better decisions, and should we? This course examines neural bases for human decisions and cognitive biases. Drawing from economics, psychology, and neuroscience, it takes an interdisciplinary perspective on topics including decision-making under risk (how humans deal with probabilities), intertemporal decisions (saving for the future), and social decisions (interpersonal allocations and fairness). Students will explore different notions of rational behavior, how data on human behavior and brain activity is collected, and how we can use these data to improve decisions. Hands-on experience will include lab visits (both behavioral and brain imaging) and data collection through online platforms as students gain familiarity with different models of decision-making (including expected utility theory vs. prospect theory for decisions under risk, exponential vs. hyperbolic discounting for intertemporal decisions, and selfish vs. social preferences for interpersonal decisions) and examine how these models reflect available neural evidence.

CDAD-UH 1043EQ  Data and Society  (4 Credits)
Typically offered Fall
Why is data science so influential and popular in business, government and academic research? What are the benefits we gain with expending resources to collect and analyze data, and what is lost when we make decisions about how to classify events? In this class, students will gain a foundational understanding of statistics, data science, and computational data analysis using data sets drawn from real-life problems, primarily with the R statistical software package. They will also be exposed to the philosophical underpinnings of quantitative analysis via scientific inquiry, along with criticism of methods and the way that data-driven analysis can be used to obscure as much as inform. Students will also undertake a group project that will involve independent data analysis on a topic of relevance to world affairs.

CDAD-UH 1044Q  Human-Centered Data Science  (4 Credits)
Typically offered Fall and Spring
Data science is changing our lives. While the importance of data science is widely acknowledged, there are also great concerns around it. How are data generated? How can they be used to make predictions and inform insights? What can be the potential dangers of applying data science techniques? What are the social and human implications of their uses? This multidisciplinary course explores these questions through hands-on experience on key technical components in data science and critical reviews of human and social implications in various real-world examples, ranging from social science to arts and humanities to engineering. In the course, students will 1) learn basic concepts and skills in data science (e.g., crawling and visualization); 2) apply these skills in a creative project; 3) discuss social and human implications of data science, including data privacy; algorithmic bias, transparency, fairness, and accountability; research ethics; data curation and reproducibility; and societal impacts. This course encourages students to reconsider our common-place assumptions about how data science works and be critical about the responsible use of data.

CDAD-UH 1045EQ  Science of Food & Cooking  (4 Credits)
Typically offered Fall and Spring
What is the real shape of your food? How do you define cooking on a molecular sense? Are all calories the same? Is industrial food really as diverse as it seems? The ever-rising wave of general interest in food has helped to knock down the barriers of science and cooking, where science found its way into house-kitchen and cooking into laboratories and industrial plants in the past three decades. This course attempts to integrate some of the broad questions, as the ones given above, by taking food as a molecular architecture and its preparation as a hypothesis-driven scientific event. The answers to these questions would touch upon matters of health, nutrition, environment and ethics of eating. The laboratory sessions would complement the in-class topics by providing hands-on activities on elucidating the science of cooking, preparation of chemical cuisines and quantitative/qualitative analysis of food components in commercial food and drinks.
Grading: Ugrd Abu Dhabi Graded

CDAD-UH 1046EQ  Infectious Diseases: Preventing and Stopping Epidemics  (4 Credits)
Typically offered Spring
What determines how a disease spreads in human populations? Biomedical scientists have greatly expanded our knowledge of the diseases caused by viruses, parasites, fungi or bacteria. Yet every year, epidemics of infectious diseases still cause large amounts of suffering, bereavement and economic loss throughout the world. Climate change, deforestation, and the globalization of economic activity might even accelerate the emergence of new infections and usher in an “era of pandemics.” In this course, students will draw on literature from the biomedical and social sciences, as well as historical accounts of outbreaks, to understand the dynamics of contagion. They will learn the tools used by epidemiologists and public health specialists to prevent the emergence, limit the spread, or even eliminate infectious diseases. They will investigate the ethical, behavioral, and political obstacles that might limit the adoption of protective behaviors during epidemics. Students will engage in debates and research related to the current COVID-19 pandemic, as well as in case studies of diseases including smallpox, influenza, malaria, HIV/AIDS, and Ebola.

CDAD-UH 1056J Sexual and Reproductive Health: A Case Study of Uganda (4 Credits)
Typically offered January term
Ensuring equity and leaving no one behind is a crosscutting theme across the United Nations sustainable development goals (SDGs), and is emphasized under universal health coverage and SDG 3.7 (ensuring universal access to reproductive health services). However, inequalities in access to sexual and reproductive health (SRH) services persist within and across countries. Adolescents and young women are among the most vulnerable groups with some of the worst indicators especially in the low and middle-income countries (LMICs) particularly in Africa. This session will introduce participants to the comprehensive SRH package, SRH indicators and trends globally and in Africa. Using Uganda as a case study in Africa, participants will review the trends in SRH indicators among adolescents and young women and the underlying drivers of the poor indicators (including early marriage, early pregnancies and mortality, among others). Using a multi-sectoral approach, participants will engage in an interactive discussion to examine current interventions, analyze the gaps and propose innovative interventions to bridge the gaps.

CDAD-UH 1057J Bioarchaeological Perspectives on Death: A Case Study in Medieval Italy (4 Credits)
Typically offered January term
How people view and treat the dead depends upon their culture; and these views can vary across time and space. Only the human skeleton can provide unbiased evidence of past lived experiences. Our skeleton is not a rigid frame that is fixed once we reach adulthood: it is a living and dynamic organ that changes in response to our activity, nutrition and disease. This multidisciplinary seminar uses human skeletal material from Florence and greater Italy who lived during the medieval period to teach data collection methods, as well as biological anthropological standards to estimate sex, age at death, and stature of people in the past. Students will learn to analyze skeletal stress markers and indicators of activity patterns to reconstruct past behavior. They will learn methods for assessing diet and health, including identifying infectious diseases, traumatic lesions and other skeletal pathologies. Discussion topics include the ethics of studying human remains, as well as cultural differences in how human bodies are viewed and treated in death. The final project will culminate in an osteobiography of an individual from medieval Italy, placing them in the context of their population as well as a larger context of medieval Europe. Students will be working with ancient human remains or casts in a laboratory setting.

CDAD-UH 1058JQ Data, Discovery, and Decision-Making in Public Health (4 Credits)
Typically offered Summer and January terms
Public health is the science of protecting and improving the health of people and their communities. This requires accurate and timely data on many events and diseases so that health policies and interventions can be adequately designed, implemented, and evaluated. How can public health data be generated within the complexity of communities and health facilities? How can these data be transformed into metrics that inform policy decisions? How do these processes play out in economic settings, where health and data systems face severe resource constraints? Pending feasible international travel conditions the course will take place in Ghana, a lower-middle-income country. Students will learn about the production of public health data through readings, data visualization, and field visits to sites where public health data are collected, processed, or discussed. Throughout the course, students will work in teams on a data-driven project aimed at addressing the barriers that limit the registration of births in Ghana, an issue that confounds a broad array of health statistics related to maternal and child health.

CDAD-UH 1060EJ Researching Peace (4 Credits)
Typically offered January term
What is peace and how does one build it? How can social science research help us answer these questions? This course investigates (1) what peace means to people around the world and how to measure it; (2) key approaches to peacebuilding; and (3) the varied methods, opportunities, and challenges of researching peacebuilding. With an approach rooted in experiential learning, students will get hands-on practice with research techniques across the project spectrum. This year, this practice concentrates on Professor King’s ongoing research exploring if, how, and to what effect leaders and ordinary people use cultural spaces like food, fashion, museums, and sports to build inclusive identities and bring people and groups together across divides. Throughout the course, students will participate in field-based research exploring these ideas around Abu Dhabi, learn how to collect and analyze quantitative and/or qualitative data, hone their abilities to ask and answer important global questions, and practice communicating scholarly work to effect positive social change.

CDAD-UH 1061J Digital Intimacies in and Beyond the Gulf (4 Credits)
Typically offered January term
What does it feel like to live out some of our most important relationships through our computers and our phones? Is the era that we’re living through radically different from all those which preceded it in how we imagine and experience our relational lives? This course explores continuity and rupture in human intimacy and relationality by taking contemporary practices in online dating as a case study. How has the proliferation of dating apps and social media platforms shaped how young people build relationships? How have love, attachment, and intimacy changed in the wake of these media? If the internet gives us both greater connection and more isolation, how are we changing to adapt ourselves to these conditions? We undertake an intensive study of these questions as they manifest in the global city of Abu Dhabi and further afield through original research. Students learn and apply ethnographic methods, both on and offline, and contribute to knowledge production in the emerging field of digital intimacy studies in and beyond the Gulf.

CDAD-UH 1062EJ The Evolution of Animal Form and Behavior (4 Credits)
Typically offered January term
The Evolution of Animal Form and Behavior: Most animals are built on the same blueprint (the early chick and human embryos look very similar), have about the same number of genes (18,000-24,000) that are very similar to each other. Yet, animals diverge very widely in their shape and behaviors. This course will investigate how organs and behaviors evolved to allow animals to adapt and thrive in their environment. We will learn about the changes during embryonic development that lead to the distinct features of animals. We will provide an understanding of how evolution works at all levels of the organism to generate the specific characteristics of animals, from lifespan (how queen ants live 30 years while their worker, twin sisters only live for a few months), to behavior (how butterflies can see so many colors to track their sexual partners), to body plan (how snakes have many more segments than human, or how bats acquire their wings), to parasitism (how the red palm weevil bore into the trunk of date palms to affect the major crop of the UAE). Through lectures, field observation, art photography, microscopy and genetics, we will illustrate the power of evolution that allows animals to occupy the most diverse ecological niches on earth and creates the beauty of life.

CDAD-UH 1063 Digital Archive (4 Credits)
Typically offered occasionally
How do digital technologies impact efforts to archive human experience and culture? How do they change how we access that archive? In the age of ubiquitous smart devices, when we are all curators of digital content, what constitutes the digital archive? This course explores the implications of digital archive creation tools and practices for historical memory and understanding. Students will conduct reviews of digital archives and online repositories and will be invited to assess the role of digitization in the construction of history and memory. Focusing on the curatorial and technical decisions underlying digitization processes and the ways in which these decisions determine what is discoverable, accessible, and searchable, students will be introduced to relevant terms and concepts, such as metadata creation, machine-readable data, open access, the digital divide, algorithmic bias, the possibilities and the ethics of crowdsourcing, distant reading, etc. Offering a gentle introduction to computer-readable corpus creation and text analytics, the course takes a Humanities approach to interrogating digital tools and platforms we encounter on a daily basis.

CDAD-UH 1064 Sustainable Supply Chains (4 Credits)
Typically offered occasionally
What are supply chains, and what do we mean when we talk about their sustainability? As corporations work to become more sustainable, what does this mean in practice? Supply chains are the backbone of large corporations; ensuring their sustainability typically means ensuring the sustainability of the corporation itself. What challenges do corporations face when moving towards environmentally sustainable or socially responsible practices? How are these dimensions of sustainability evaluated and weighed against one another? This course examines elements of a supply chain, including purchasing, inventory, manufacturing, operations management, transportation and logistics, scheduling, and network design. It asks how attention to health, human rights, and the environment can be incorporated into supply chain design by studying economic, environmental, and social impacts. Applying these principles to maritime, airline, and global manufacturing industries - whose supply chains can be strongly affected by external and unplanned factors such as pandemics - students will explore their impact in real-life applications.

CDAD-UH 1065E What is Life? (4 Credits)
Typically offered Spring
What distinguishes living organisms from non-living systems, and how did the latter transition to living? How do organisms evolve, and can we expect to find life elsewhere in the universe like ours? Answering these questions allows us to better understand life on our planet and how new evolutionary trajectories can arise, resulting in the appearance of more complex species as well as new viruses and pathogens. The course begins with analyzing the distinguishing features of living organisms and examining the boundaries that non-living systems had crossed to become living. The class then explores how extant organisms use their DNA as blueprints to replicate themselves and evolve. In the last segment, students will learn how researchers are editing DNA and have re-written life’s genetic code to generate synthetic life indistinguishable from natural ones. The course uses lectures and laboratory exercises to interrogate these questions.

CDAD-UH 1066EJ Fermentation (4 Credits)
Typically offered January term
The practice of fermenting foods dates back to 7000 BC. Many contemporary human societies continue to ferment foods for preservation, to enhance flavors, and to create new dishes. Fermented foods contain live microbes—bacteria and fungi—that can impact our health directly or via interaction with our gut microbiota (microbes that naturally live in our gut). But what is the science behind fermentation? Why has this practice persisted for so long? What will we lose if this ancient practice perishes in our processed-food-rich industrialized world? This data and discovery course not only explores the specific roles that microbes play in biochemically transforming raw ingredients into tasty, flavorful edibles but it also examines the historical, cultural, and economical aspects of fermented foods in traditional societies via regional and global exploration of the art of fermenting foods and consumption practices. In addition to discussions of scientific literature and audiovisual materials, students will take advantage of the cosmopolitan nature of Abu Dhabi, to conduct in-class blind-taste experiments to assess palatability of regional and global traditionally fermented foods that are commercially available in local supermarkets.

CDAD-UH 1067Q Epidemiology for Global Health (4 Credits)
Typically offered occasionally
By the end of this course students will develop the ability to understand the evolution and current role of epidemiology as an approach to assessing public health problems; describe epidemiological approaches to defining and measuring health problems in defined populations; understand how epidemiologic studies are designed, implemented and analyzed; understand the concepts of measurement of test performance and be able to apply these concepts of testing and screening in a range of health and other settings; understand and apply epidemiological criteria needed to establish cause and effect relationships; understand, and apply key ethical issues to the conduct of epidemiological and other scientific investigations; conduct library research to find information on diseases and other health conditions; and critically read and understand health information.

CDAD-UH 1069EQ Climate Change (4 Credits)
Typically offered occasionally
Climate change is among the most complex and challenging problems that we have confronted as a civilization, but the responses and impacts will vary largely across space and the global population. This course is designed to give you an overview of the scientific basis of climatic change, and will expose you to multiple facets of a very interdisciplinary and encompassing field. You will be introduced to the physical science of our climate system, the contributing system components, and the basic mechanisms that govern how the climate system responds to drivers of change. We’ll then explore climate change from multiple perspectives: paleoclimatic change, recent historical variability and change, future climate projections as well as social and economic issues. Each session will start with a discussion about a scientific paper (or parts of the IPCC report) followed by a one hour lecture and practical work at the end of each session. The practical work will have large components of learning scientific writing and presentation.

CDAD-UH 1070J  Sustainable Urban Transportation Planning for the 21st Century (4 Credits)
Typically offered January term
How do urban transportation systems arise? How are they planned? What is the role of transportation planning in advancing the goals of sustainable development? How do we measure sustainability in relation to transportation? In this class students will engage with the many public policy challenges current transportation systems face, from environmental quality and social equity to economic vitality and the threat of climate change. Readings, discussions and assignments will offer an overview of theories, policies, and implementation tools for advancing sustainable transportation and urbanization programs and help students appreciate the complexities of varying contexts and practices. Beginning with analysis of worldwide trends and projections for urbanization and urban travel, students will examine key transportation planning and policy issues raised by current conditions, trends, and projections. Drawing on case studies from emerging economies as well as developed cities, and a regional seminar in Athens, students will conduct qualitative and quantitative analysis of transportation modes as well as operations and management strategies that can be used to increase sustainability. Note: Pending feasible international travel conditions, this course will include a seminar in Germany.

CDAD-UH 1071EQ  Stereotyping (4 Credits)
Typically offered Fall
Stereotypes are socially shared and affect us collectively. At a personal level, they shape our self-concepts, abilities, social identities, and our social interactions. At the societal level, stereotypes pervade our culture, our institutions, and our science in subtle ways that often escape our awareness. In this course, we will explore the origins and the social transmission of stereotypes, the (often unconscious) processes by which stereotypes operate, and the way they are transmitted from person to person and from generation to generation. We will analyze the way in which stereotypes permeate all aspects of our society (including science) and how public policies can curtail their negative effects. These questions will be addressed from different vantage points and analyzed through existing and self-generated data able to uncover blatant and hidden stereotypes. Hands-on experiences will include data collection from different sources (publicly available statistics, google trends, etc.) as well as the design of a small-scale empirical study; this will allow you to gain familiarity with both correlational and experimental methods.

CDAD-UH 1072Q  Nothing (4 Credits)
How can a course be about nothing? How can anything be about nothing? We all use the word "nothing" (probably several times a day) without hesitation, but if we stopped to think about its meaning, we would realize that "nothing" is a complex, multi-faceted, ever-changing concept. To talk about "nothing," we need to first set rules and boundaries. This course explores the evolution of the concept of nothing in mathematics, philosophy and, especially, physics over the centuries. We will discuss the history of the concept of zero, ideas of nothing and everything in ancient philosophy, the concept of limit, which is at the heart of modern mathematics, and the theories of relativity and quantum physics, which represent the foundations of our modern understanding of the universe. We will ask age-old questions that have occupied natural philosophers for millennia: Why is there something rather than nothing? Where does everything come from? Can something come from nothing? What is nothing anyway? Along the way, we will see how developing scientific theories requires taking basic concepts—like the concept of "nothingness"—and making them precise enough to support scientific inquiry. We will discover that such a process can lead to a radical revision of basic concepts we might have thought were unambiguous.

CDAD-UH 1073Q Science of Complexity (4 Credits)
Our world is a collection of wondrously complex systems. We may wonder why stock markets suddenly crash or how our bodies work so well for so long. We may wonder why climate changes or how our decisions affect others and the ecology we are part of. We may even wonder why we wonder, i.e., how our brain works. What makes systems complex, and what makes some questions particularly difficult to answer? The science of complexity can illuminate all of these apparently disconnected systems and behaviors. It aims to understand how complex behaviors emerge when relatively simple, single elements are brought together into a collective. In this course, we study the science of complexity through examples from the physical sciences, the social sciences, and the arts. We will learn the tools and concepts needed to extract simple insights about complex systems and will use these concepts and tools to better understand our own absorbing questions about the world around us.

CDAD-UH 1074EQ Science of Martial Arts (4 Credits)
Typically offered occasionally
Martial arts are ubiquitous in the world and are practiced for many reasons beyond warfare, including sport, spiritual development, cultural heritage, and entertainment. In fulfilling their purpose in attack or defense, martial arts techniques must be honed for effectiveness and efficiency, since an optimal movement can make the difference between safety and harm. What enables and limits motions of the human body? In this course, we will learn and analyze the physical and biomechanical laws that govern the basic striking and throwing techniques as well as defenses against these attacks, both theoretically and practically in a PHYED portion and laboratory experiments. We will investigate the science of arms and armor, including modern protective equipment, and discuss the similarities and differences in techniques in different martial arts. The secondary aspect of the course will focus on the link between martial arts and the societies in which they developed, as well as how they have spread to other cultures. How have the society shaped the martial arts practiced and vice versa? We will examine the development of martial techniques into spiritual paths and into modern day sports, as well as depictions of martial arts in popular culture.

CDAD-UH 1075EQ Quantum Computing for Everyone: Embracing the Quantum Revolution (4 Credits)
Typically offered occasionally
Is Schrödinger’s cat dead or alive? This famous thought experiment highlights the mysterious nature of quantum mechanics, a powerful theory that explains the principles of nature at the atomic level. In 1982, Feynman suggested the utilization of the principles of quantum mechanics to construct a quantum computer for investigating the quantum world we live in. Quantum technology is expected to revolutionize the world. Are we ready for it? The objective of this course is to acquaint students with the mysterious nature of Quantum Mechanics and its role in computing. Along with fundamental theories, students will engage in practical exercises on a 2-qubit quantum computer at NYUAD’s Quantum Lab. They will acquire knowledge about the fundamentals of quantum mechanics and quantum computing, and comprehend the real-world applications of quantum computing across several domains, including finance, ultra-secure communication, sensing, physics, chemistry, and biology. The course will also delve into the influence of quantum computing beyond science and technology, extending into the realms of arts and humanities.

CDAD-UH 1077 Chemophobia (4 Credits)
Typically offered Spring
The first rule of confronting chemophobia is not to use the word chemophobia. Only by proper communication and education can anti-scientific opinions be confronted more effectively. Chemophobia, an aversion to or prejudice against chemicals or even against chemistry, is one of the most pervasive and challenging science-related phobias to confront. How have people come to distrust chemicals in everyday use and does this distrust threaten public health and security? What are the origins of this phenomenon? This course examines key historical events (exposure to pesticides, industrial disasters, uses of chemicals in warfare) and social and sub-cultural trends that triggered the chemophobia epidemic. Acknowledging the dangers and damages associated with hazardous chemical processes, misuses, and accidents, we analyze both rational and irrational bases that led to the emergence of chemophobic sentiments. We examine whether one can measure and compare levels of chemophobia and anti-scientific attitudes across societies. We also consider how chemists and journalists can help reduce the level of chemical paranoia through education and communication and why this is so important.
