

BIOLOGY (BIOL-GA)

BIOL-GA 1001 Bio Core I: Molecular Systems (4 Credits)

Typically offered Fall

This intensive team-taught core course surveys the major areas of up-to-date molecular biology, molecular genetics and systems biology. Topics include the molecular structure and function of proteins and polynucleic acids and their fundamental roles in cell biology and disease. A strong emphasis will be placed on novel experimental approaches that form basis of the current wave of discovery in biomedicine.

Grading: GSAS Graded

Repeatable for additional credit: No

BIOL-GA 1002 Bio Core II: Cellular Systems (4 Credits)

Typically offered Spring

This intensive team-taught core course surveys the major areas of up-to-date cell biology. Topics include review of cell and membrane structure, organelle function, cytoskeletal dynamics, cell motility and division, cell cycle, cellular energetics, protein and ion transport, cell signaling, stem and nerve cells, immunology and cancer.

Grading: GSAS Graded

Repeatable for additional credit: No

BIOL-GA 1004 Environmental Health (4 Credits)

Typically offered occasionally

Discusses some of the basic concepts of environmental science and major global environmental problems, such as global warming, soil erosion, overpopulation, and loss of biota. Another part of the course focuses on environmental health problems, such as exposure to lead, mercury, halogenated hydrocarbons, asbestos, and radon. Other lectures are devoted to carcinogenesis, air pollution, toxic wastes, epidemiology, and risk assessment.

Grading: GSAS Graded

Repeatable for additional credit: No

BIOL-GA 1006 Toxicology (4 Credits)

Typically offered Fall

Introduction to the science of toxicology, stressing basic concepts essential to understanding the action of exogenous chemical agents on biological systems. Principles underlying the absorption, metabolism, and elimination of chemicals are discussed. Toxicokinetics, specific classes of toxic responses, and experimental methods used to assess toxicity are also examined.

Grading: GSAS Graded

Repeatable for additional credit: No

BIOL-GA 1007 Programming for Biologists (4 Credits)

Typically offered Fall

This course provides introductory theory and hands-on training in bioinformatics for graduate students or advanced undergraduates in biology who have no prior computational experience. Knowledge of foundational concepts and practical applications acquired in this course will provide a starting point for further advanced study in bioinformatics and computational biology. Hands-on exercises will introduce students to the Linux operating system and provide basic computer programming skills as applied to bioinformatics, using Python. Topics covered: pairwise and multiple sequence alignment, BLAST and related algorithms, sequence motifs, Hidden Markov Models, gene expression analysis, and resources for functional associations (gene ontology, pathways and networks).

Grading: GSAS Graded

Repeatable for additional credit: No

BIOL-GA 1009 Biological Databases & Datamining (4 Credits)

Typically offered Spring

The course is divided into three sections: 1) Introduction to MySQL and R. 2) Introduction to different data types, and 3) Machine learning methods for data mining. Students will learn to create their own database using MySQL and SQLite containing different types of biological data. Students will also learn to mine the heterogeneous biological data using machine-learning methods such as Support Vector Machines and Multiple Regressions. We will apply these methods on experimental data in order to classify and prediction gene function and regulation.

Grading: GSAS Graded

Repeatable for additional credit: No

BIOL-GA 1011 Immunobiology (4 Credits)

Typically offered occasionally

Focuses on the mechanisms that govern the immune response and also trains students in reading and evaluating primary research articles that are published in peer-reviewed journals.

Grading: GSAS Graded

Repeatable for additional credit: Yes

BIOL-GA 1016 Imaging Science (4 Credits)

Highlights basic principles of preparation and imaging relevant to biomaterials research, particularly as they relate to 2-D and 3-D transmitted and reflected light microscopy and scanning electron microscopy of bone and tooth microanatomy. Provides students with the opportunity to work with samples, the purpose being to integrate preparation methods for some specific imaging mode(s). Also exposes students to and allows them to perform digital processing, analysis, and measurements of images acquired from their prepared samples.

Grading: GSAS Graded

Repeatable for additional credit: No

BIOL-GA 1020 Adv Top Cell/Molec Immun (4 Credits)

Typically offered occasionally

In-depth exploration of a topic in cellular and molecular aspects of immunity, including cellular interactions, antigen processing and presentation, pathogenesis, viral immunology, and cytokines.

Grading: GSAS Graded

Repeatable for additional credit: Yes

BIOL-GA 1022 Cornerstones of the Central Dogma (4 Credits)

Typically offered Spring

A single scientific paper can create or revolutionize an entire field. Each week we will critically evaluate a single paper that made a lasting impact on molecular biology. Focus will be on the methodological innovation and scientific rigor that underlies these seminal works. The subsequent interactive lecture will explore a research topic suggested by the discussion paper, tracing it to the 21st century through the guided analysis of 2-3 key papers. Despite its focus on classic literature, this course is not simply historical: the major emphasis in both the discussion and lecture components will be on fundamental biological questions, experimental design, and the interpretation of data.

Grading: GSAS Graded

Repeatable for additional credit: No

BIOL-GA 1023 Hot Topics in Infectious Diseases (4 Credits)*Typically offered Spring*

The relationship between microbial pathogens and their human hosts is continuously changing. Although our immune system has become extremely sophisticated throughout evolution, microbes are also evolving at a fast rate to overcome host defenses. The development of techniques, such as sanitation and vaccination, and the discovery of antimicrobial drugs, such as antibiotics, has revolutionized medicine. However, even though some infectious diseases have been eradicated (e.g., smallpox), others that were on the verge of extinction are re-emerging (e.g., TB) and new ones have gained prominence (e.g., AIDS). This course is designed as a detailed survey of some of the most important human pathogens. It investigates these agents in detail and includes the most cutting edge basic research findings as well as epidemiology, treatment and prevention of infections.

Grading: GSAS Graded**Repeatable for additional credit:** No**BIOL-GA 1031 Special Topics in Biology (4 Credits)***Typically offered occasionally*

This course focuses on a specific topic in biology, indicated in the subtitle. The format of the course includes lectures as well as discussion of primary research articles.

Grading: GSAS Graded**Repeatable for additional credit:** Yes**BIOL-GA 1032 Metabolic Disorders (4 Credits)**

The course will discuss how normal physiological processes of the human body are disrupted by diseases. The cellular and molecular basis of physiological disorders such as the triad of metabolic syndrome (obesity, hypertension, and diabetes) and discuss how diseases such as cancer affect and interact with physiological systems will be covered. Class time will be a combination of lecture, discussion, and recitation.

Grading: GSAS Graded**Repeatable for additional credit:** No**BIOL-GA 1045 Protein Biochemistry (4 Credits)***Typically offered Fall and Spring*

Provides students with a firm and rigorous foundation in the principles of modern protein biochemistry. These concepts form the basis for many of the great mechanistic advances now being made in biology and the medical sciences. The course will discuss the fundamental processes that enable proteins to form complex biological structures, respond to the environment, catalyze chemical reactions and perform work. A strong emphasis will also be placed on the state-of-the-art experimental approaches driving the current revolution in biochemical research.

Grading: GSAS Graded**Repeatable for additional credit:** No**BIOL-GA 1051 Cell Biology: (4 Credits)***Typically offered occasionally*

In depth look at selected processes and structures in the eukaryotic nucleus. The course covers topics including nucleosomes, histone modifications, epigenetics, non-coding RNAs, nuclear bodies, through lectures and discussions of primary research articles.

Grading: GSAS Graded**Repeatable for additional credit:** No**BIOL-GA 1052 Frontiers in Microbiology (4 Credits)**

This course will examine the principles of genetic circuit design in microbes by comparing a variety of naturally occurring genetic circuits that perform various functions (logic gates, oscillators, switches, memory, etc.) to engineered, synthetic circuits that perform similar functions. Coursework will include a quantitative review of gene regulation, reading of the primary literature concerning natural and synthetic genetic circuits, and mathematical/computational modeling of simple genetic circuits. Undergraduates must have Molecular and Cell Biology II (BIOL-UA 22). All students must have taken one semester of college-level calculus.

Grading: GSAS Graded**Repeatable for additional credit:** No**BIOL-GA 1069 Principles of Evolution (4 Credits)***Typically offered Spring term of even numbered years*

Patterns of evolution and adaptation as seen in the paleontological record; speciation, extinction, and the geographic distribution of populations; the basics of population genetics and molecular evolution. Elements of numerical taxonomy and recent developments in phylogenetic systematics.

Grading: GSAS Graded**Repeatable for additional credit:** No**BIOL-GA 1080 Emerging Pathogens (4 Credits)***Typically offered Fall and Spring*

Details a number of emerging pathogens either new in the population or increasing in incidence or geographic range, that infect human beings. Topics include pathogenic factors leading to disease, host response, clinical illness, epidemiology and epidemic potential for each pathogen as well as any relevant bacteriology, virology, and immunology.

Grading: GSAS Graded**Repeatable for additional credit:** No**BIOL-GA 1082 Genes, Neurons and Behavior (4 Credits)***Typically offered occasionally*

Survey of principles and patterns of animal behavior. Covers classical ethological research of Lorenz and others and modern research on the molecular basis of behavior, especially in model systems. Behaviors studied include reproductive behavior, rhythmic behavior, learning and memory, and feeding behavior.

Grading: GSAS Graded**Repeatable for additional credit:** No**BIOL-GA 1101 Neuroplasticity and Disease (4 Credits)***Typically offered Spring*

An introductory multidisciplinary course in Neuroplasticity is offered which covers the basic principles of biology, anatomy, endocrinology and pharmacology in typical and atypical human physiology in health and disease. All cells in the brain will be studied including stem cells, neurons, astrocytes, microglia and pericytes. Human diseases will be organized in clusters of Global Insults (e.g. tumors and strokes); Genetic Diseases (e.g. Huntington's and Down syndrome); Region Specific diseases (e.g. Parkinson's and oppositional defiant disorder); Chemical associated diseases (e.g. FAS and depression) and Treatments (e.g. opiates and amphetamines) These topics will be discussed in class on how they impact cytoskeletal and spine dynamics, neuronal migration, degeneration, memory, and aggression. Special attention is paid to the cellular actions of neurotransmitters, stress hormones, trophic factors, marijuana and opiates. Discussion of current literature and preparation of a term paper provide an in depth coverage of the subject of neuroplasticity and how it relates to human diseases.

Grading: GSAS Graded**Repeatable for additional credit:** No

BIOL-GA 1120 Developmental Biology (4 Credits)*Typically offered occasionally*

The course is an depth coverage of developmental principles using diverse models from animals to plants. The course covers experimental strategies of developmental biology that have led to discoveries relevant to modern medicine and human health. These include limb, heart, and embryonic development in models that form the basis of our understanding of animal development. The course also covers recent advances in stem cell biology and induced pluripotency that are highly relevant to human health. The course covers these topics through the exploration of basic biology that uses molecular, biochemical, and genetic techniques. A basic knowledge of molecular biology is expected.

Grading: GSAS Graded**Repeatable for additional credit:** No**BIOL-GA 1122 Lab Molecular Biology I (4 Credits)***Typically offered Fall*

Analyzes selective developmental systems using recombinant DNA techniques. Purification of nucleic acids from eukaryotes and prokaryotes; bacteria transformation; restriction enzyme analysis; immobilization of nucleic acids on nitrocellulose membrane; and DNA-DNA, DNA-RNA hybridization.

Grading: GSAS Graded**Repeatable for additional credit:** No**BIOL-GA 1123 Lab Molecular Biology II (4 Credits)***Typically offered occasionally*

Analyzes selective developmental systems using recombinant DNA techniques. Purification of nucleic acids from eukaryotes and prokaryotes; bacteria transformation; restriction enzyme analysis; immobilization of nucleic acids on nitrocellulose membrane; and DNA-DNA, DNA-RNA hybridization.

Grading: GSAS Graded**Repeatable for additional credit:** No**BIOL-GA 1124 Lab in Molecular Bio III (4 Credits)***Typically offered Fall, Spring, and Summer terms*

This course comprises an independent laboratory research project performed by the student under the supervision of a research mentor. Students typically spend ~15-20 hours a week in the lab on their research project.

Grading: GSAS Graded**Repeatable for additional credit:** No**BIOL-GA 1125 Lab Molecular Biology IV (4 Credits)***Typically offered Fall, Spring, and Summer terms*

This course comprises an independent laboratory research project performed by the student under the supervision of a research mentor. Students typically spend ~15-20 hours a week in the lab on their research project.

Grading: GSAS Graded**Repeatable for additional credit:** No**BIOL-GA 1126 Advanced Genetics (4 Credits)***Typically offered occasionally*

In-depth study of experimental genetics from Mendel to the present, emphasizing methods and logic of the genetic approach to biological research. Covers classical experiments on inheritance, chromosomes and genetic linkage, genetic variability, mutagenesis, DNA, and the nature of the genetic code. Special topics from both classic and recent literature include (but are not limited to) genetic screens, epistasis analysis, suppressors/enhancers, and mosaic analysis.

Grading: GSAS Graded**Repeatable for additional credit:** No**BIOL-GA 1127 Bioinformatics & Genomes (4 Credits)***Typically offered Spring*

The recent explosion in the availability of genome-wide data such as whole genome sequences and microarray data led to a vast increase in bioinformatics research and tool development. Bioinformatics is becoming a cornerstone for modern biology, especially in fields such as genomics. It is thus crucial to understand the basic ideas and to learn fundamental bioinformatics techThe recent explosion in the availability of genome-wide data such as whole genome sequences and microarray data led to a vast increase in bioinformatics research and tool development. Bioinformatics is becoming a cornerstone for modern biology, especially in fields such as genomics. It is thus crucial to understand the basic ideas and to learn fundamental bioinformatics techniques. The emphasis of this course is on developing not only an understanding of existing tools but also the programming and statistics skills that allow students to solve new problems in a creative way.

Grading: GSAS Graded**Repeatable for additional credit:** No**BIOL-GA 1128 Systems Biology (4 Credits)***Typically offered Fall*

Topics cover a wide range of genomics techniques, ranging from genomics, transcriptomics, proteomics, interactomics, translomics, to genome-wide association studies and "chromatinomics." Emphasis is placed on possibilities opened by experimental techniques, fundamental approaches to data analysis, and interpretation of the results with respect to their scope and limitations. The course does not involve programming.

Grading: GSAS Graded**Repeatable for additional credit:** No**BIOL-GA 1129 Evolutionary Genetics & Genomics (4 Credits)***Typically offered Spring*

The genetic and genomic mechanisms underlying evolutionary change, including the genetics of adaptation and character regression; evolution of complex characters and traits such as organ systems, the senses, and patterns of behavior; methods for the study of quantitative trait locus (QTL) variation and multifactorial systems.

Grading: GSAS Graded**Repeatable for additional credit:** No**BIOL-GA 1130 Appl Genomics: Intro to Bioinformtcs & Netwrk Mod (4 Credits)***Typically offered Spring*

This course introduces fundamental methods of analyzing large data sets from genomics experiments. Through a combination of lectures, hands-on computational training, and in-depth discussions of current scientific papers, students learn the conceptual foundations of basic analytical methods, the computational skills to implement these methods, and the reasoning skills to read critically the primary literature in genomics. Analysis focuses on data from genome-wide studies of gene expression using microarrays and from genome-wide studies of molecular interactions. Methods covered include clustering, multiple-hypothesis testing, and network inference. A large part of the course is dedicated to students completing an individual project that is tailored to meet their background and training.

Grading: GSAS Graded**Repeatable for additional credit:** No

BIOL-GA 1131 Biophysical Modeling of Cells & Populations (4 Credits)*Typically offered Spring*

This course covers modeling of biological systems at multiple levels. The first part of the course begins with some basic molecular biology, including cooperative binding and simple induction of genes. A general approach to quantitative modeling of transcriptional regulation is developed and then applied to study small genetic circuits with feedback loops. Pattern formation and the mechanisms by which cells perceive spatial information from chemical signals are studied, and how biological systems can function robustly in the face of noise is investigated. In the second part of the course, cellular behaviors within heterogeneous populations are studied; also, population models are introduced (and relate the population models to the molecular/cellular models of the first part of the course). Diverse biological examples will be presented over the course of the semester to illustrate key concepts in modeling.

Grading: GSAS Graded**Repeatable for additional credit:** No**BIOL-GA 1132 Genomics of Human Populations (4 Credits)**

This course covers topics in the field of human population genetics including human ancestry and admixture, human demography, linkage disequilibrium, genome-wide association studies (GWAS), genetic architecture of human traits and diseases, natural selection in the human genome, and application of population genomics to the study of cancer and disease. The course includes lecture and recitation components with the latter geared to teaching students basic skills in population genomic data analysis.

Grading: GSAS Graded**Repeatable for additional credit:** No**BIOL-GA 1140 Genomic Innovation (4 Credits)**

This course focuses on understanding the current landscape of genome science and building ideas and organizations to accelerate progress in technology innovation, scientific understanding and industrial applications of genomics. The course will introduce students to cutting-edge technologies and applications in genetics and genomics and their responsible use in science and society.

Grading: GSAS Graded**Repeatable for additional credit:** No**BIOL-GA 1501 Math in Medicine/Biology (4 Credits)***Typically offered Fall*

Discussion of topics of medical importance using mathematics as a tool: control of the heart, optimal principles in the lung, cell membranes, electrophysiology, countercurrent exchange in the kidney, acid-base balance, muscle, cardiac catheterization; computer diagnosis. Material from the physical sciences and mathematics is introduced and developed.

Grading: GSAS Graded**Repeatable for additional credit:** No**BIOL-GA 1502 Computers in Medicine & Biology (4 Credits)***Typically offered occasionally*

Introduces students of biology or mathematics to the use of computers as tools for modeling physiological phenomena. Each student constructs two computer models selected from the following: circulation, gas exchange in the lung, control of cell volume, and the renal countercurrent mechanism.

Grading: GSAS Graded**Repeatable for additional credit:** No**BIOL-GA 2003 Bio Core III: Molecules & Cells/Discussion Based (4 Credits)***Typically offered Fall*

This intensive team-taught course complements the lecture course Bio Core 1 by providing in-depth discussions of modern papers on topics related to those addressed in Bio Core 1, i.e., molecular and cellular biology from molecular structure and function of proteins/nucleic acids to cell division and apoptosis. These discussions are led by the same faculty who teach the corresponding lectures in Bio Core 1 and who have deep expertise in each area. This course is part of the suite of courses Bio Core 1-4.

Grading: GSAS Graded**Repeatable for additional credit:** No**BIOL-GA 2004 Bio Core IV: Genes, Systems & Evolution (4 Credits)***Typically offered Spring*

This intensive team-taught course complements the lecture course Bio Core 2 by providing in-depth discussions of modern papers on topics related to those addressed in Bio Core 2, i.e., genetics, systematics, genomics, systems biology, development, plants, immunology, neurobiology, evolution, and geobiology. These discussions are led by the same faculty who teach the corresponding lectures in Bio Core 2 and who have deep expertise in each area. This course is part of the suite of courses Bio Core 1-4.

Grading: GSAS Graded**Repeatable for additional credit:** No**BIOL-GA 2005 Current Topics in Biology I: (2 Credits)**

This course aims to provide students with the skills to critically read and evaluate primary literature articles in a small class setting. The course will guide students through papers by starting with a brief overview of the weekly topic and an introduction to the terminology used. In addition, it provides students with an in-depth look into a current area of biology including recent discoveries relevant to human health. The course is designed to improve the ability of students to critically evaluate scientific discoveries and ultimately to design experiments of their own.

Grading: GSAS Graded**Repeatable for additional credit:** Yes**BIOL-GA 2006 Current Topics in Biology II: (2 Credits)**

This course aims to provide students with the skills to critically read and evaluate primary literature articles in a small class setting. BIOL-GA 2008 Current Topics in Biology IV: (2 Credits)

This course aims to provide students with the skills to critically read and evaluate primary literature articles in a small class setting. The course will guide students through papers by starting with a brief overview of the weekly topic and an introduction to the terminology used. In addition, it provides students with an in-depth look into a current area of biology including recent discoveries relevant to human health. The course is designed to improve the ability of students to critically evaluate scientific discoveries and ultimately to design experiments of their own.

Grading: GSAS Graded

Repeatable for additional credit: Yes

BIOL-GA 2015 Genomics and Public Health (4 Credits)

Typically offered Spring

This course describes the developing relationship between genomics and genomic technologies with the health of populations in a global context. Topics covered include genomic technologies and their applications, genetic epidemiology, the human microbiome, infectious disease genomics, and the ethical, legal and social implications of genomics. The course consists of lectures, group discussions focused on current scientific papers, guest seminars, and a hands-on sequencing workshop. Students will leave the course with an increased awareness of how sequencing of microbes, parasites and human genomes helps develop better diagnostics and therapies and a greater understanding of human health globally. **PREREQUISITES** Students that are not Biology majors or who have not taken Biocore I (BIOL-GA.1001) should contact the Instructor prior to enrollment to discuss their academic background in biology.

Grading: GSAS Graded

Repeatable for additional credit: No

BIOL-GA 2017 Structure-Function Relat in Cellular Macromolecul (4 Credits)

Typically offered Spring

Cellular macromolecules, particularly nucleic acids and proteins, are the key molecules that provide cells with functional diversity. The nucleic acids DNA and RNA act as the informational storage and transmission molecules of cells, while proteins execute and regulate most cellular activities and provide crucial structural elements. The tools of the biochemist and molecular biologist have provided scientists with unprecedented structural detail of these macromolecules, so much so that an understanding of the critical relationships between macromolecular structure and macromolecular function can now be made. This course emphasizes key structure-function relationships for DNA, RNA, and proteins. The detailed structures of these molecules are examined; important methods and tools used to elucidate their structural elements are described; and the relationship between cellular macromolecules, particularly nucleic acids and proteins, are the key molecules that provide cells with functional diversity. Grading: GSAS Graded

Repeatable for additional credit: No

BIOL-GA 2030 Statistics in Biology (4 Credits)

Typically offered Fall and Spring

Advanced course on techniques of statistical analysis and experimental design that are useful in research and in the interpretation of biology literature. Principles of statistical inference, the design of experiments, and analysis of data are taught using examples drawn from the literature. Covers the use of common parametric and nonparametric distributions for the description of data and the testing of hypotheses.

Grading: GSAS Graded

Repeatable for additional credit: No

BIOL-GA 2031 Statistics and Machine Learning for Genomics (4 Credits)

Typically offered occasionally

Next-generation sequencing has led to the rise of large and noisy biological datasets, which require increasingly advanced analytical methods to glean biological insights. This course aims to enable students to analyze diverse types of genomic data, ranging from studies focused on human genetics (i.e. Genome-wide association studies), to functional genomics (i.e. ChIP-seq or RNA-seq, extending even to the single cell level) To accomplish this, we will review the theory and implementation behind key concepts and methods in statistical learning, and apply these to genomic datasets. The course will roughly be divided into two sections: supervised and unsupervised learning. In the first section, we will focus on predictive algorithms that perform classification and regression based on training datasets. In the second section, we will explore methods used to identify hidden structure in large genomics datasets, in particular, clustering algorithms and dimensional reduction techniques.

Grading: GSAS Graded

Repeatable for additional credit: No

BIOL-GA 2040 Molecular and Genetic Toxicology (4 Credits)

Typically offered Fall

Analyzes the modes by which organisms handle damage to DNA by physical and chemical agents, the mechanisms of converting damage to mutations, and the theoretical basis for carcinogenesis screening methods utilizing mutagenesis. Topics include systems for mutagenesis testing, mutational spectra, and inducible responses to DNA damage.

Grading: GSAS Graded

Repeatable for additional credit: No

BIOL-GA 2130 Developmental and Stem Cell Systems I (2-6 Credits)

Typically offered occasionally

Explores fundamental questions, concepts, and methodologies of modern inquiry into the genetic and epigenetic mechanisms of development through lectures, readings in the primary literature, and laboratory work. Topics include embryonic axis determination, region-specific gene expression, cell specification through cell-cell interaction, gastrulation, and organogenesis.

Grading: GSAS Graded

Repeatable for additional credit: No

BIOL-GA 2131 Developmental and Stem Cell Systems II (2-6 Credits)

Typically offered occasionally

Fundamental questions, concepts, and methodologies of modern inquiry into the genetic and epigenetic mechanisms of development are explored through lectures, readings in the primary literature, and laboratory work.

Grading: GSAS Graded

Repeatable for additional credit: No

BIOL-GA 2221 Developmental Neurobiology (4 Credits)*Typically offered occasionally*

Recent advances in genetic model systems as well as the development of new tools in vertebrate embryology have allowed much insight into the development of the central nervous system (CNS). This course focuses on the development of well-studied central nervous systems through a comparison of invertebrate and vertebrate species. It provides an in-depth description of the molecular and cellular mechanisms that pattern the CNS. Topics include cell specification, synapse formation, and use-dependent plasticity.

Grading: GSAS Graded**Repeatable for additional credit:** No**BIOL-GA 2303 Intro to Biostatistics (4 Credits)***Typically offered Fall*

Introduction to probability and statistical methods utilized in the analysis and interpretation of experimental and epidemiologic data. Statistical techniques associated with the normal, binomial, Poisson, t, F, and chi-squared distributions, plus an introduction to nonparametric methods. Applications in biology, medicine, and the health sciences.

Grading: GSAS Graded**Repeatable for additional credit:** No**BIOL-GA 2310 Principles of Toxicology (4 Credits)***Typically offered Spring*

Broad introduction to the science of toxicology, stressing basic concepts essential to the understanding of the action of exogenous chemical agents on biological systems. Principles underlying the absorption, metabolism, and elimination of chemicals are discussed. Toxicokinetics, specific classes of toxic responses, and experimental methods used to assess toxicity are reviewed.

Grading: GSAS Graded**Repeatable for additional credit:** No**BIOL-GA 3001 The Art of Scientific Investigation (2 Credits)***Typically offered Fall*

This course in the ethics and communication of scientific research is designed to complement the more information-based courses offered by the Department of Biology and equips Ph.D. students with the necessary skills to conduct research ethically and to be aware of the ethical and societal implications of their research. The course also trains students in effective scientific communication through paper writing and presenting research to specialist and nonspecialist audiences and in fellowship and grant writing.

Grading: GSAS Graded**Repeatable for additional credit:** No**BIOL-GA 3015 Pre-Doctoral Colloquium (2 Credits)***Typically offered Fall and Spring*

Students gain experience in the preparation and presentation of formal scientific seminars.

Grading: GSAS Pass/Fail**Repeatable for additional credit:** Yes**BIOL-GA 3025 NYU-STEP Individual Development Plan (1 Credit)***Typically offered Fall and Spring*

A ten week introduction for trainees to explore their interests, strengths, goals, and career options. Initially, each participant will complete myIDP online and then discuss their results. In addition, panel discussions with professionals in different potential jobs and strategies for job searches will be included.

Grading: GSAS Pass/Fail**Repeatable for additional credit:** No**BIOL-GA 3034 Predoc Col Srvy Lab Mthd (2 Credits)***Typically offered Fall*

First term: Students attend orientation sessions with individual faculty to discuss current departmental research.

Grading: GSAS Graded**Repeatable for additional credit:** Yes**BIOL-GA 3035 Predoc Col Srvy Lab Mthd (4 Credits)***Typically offered Spring*

Second term: Each student arranges to complete three projects (six to eight weeks in duration), each under the supervision of a different faculty member, in the department's laboratories.

Grading: GSAS Graded**Repeatable for additional credit:** Yes**BIOL-GA 3303 Research (1-6 Credits)***Typically offered Fall and Summer terms*

Individual research projects carried out under the supervision of the faculty.

Grading: GSAS Graded**Repeatable for additional credit:** Yes**BIOL-GA 3304 Research (1-6 Credits)***Typically offered Spring and Summer*

Individual research projects carried out under the supervision of the faculty.

Grading: GSAS Graded**Repeatable for additional credit:** Yes**BIOL-GA 3305 Reading (1-6 Credits)***Typically offered Fall and Summer terms*

Reading and analysis of selected literature in a specific area of biology under the supervision of the faculty. Gives students intensive coverage of material that is appropriate for their individual research needs.

Grading: GSAS Graded**Repeatable for additional credit:** Yes**BIOL-GA 3306 Reading (1-6 Credits)***Typically offered Spring and Summer*

Reading and analysis of selected literature in a specific area of biology under the supervision of the faculty. Gives students intensive coverage of material that is appropriate for their individual research needs.

Grading: GSAS Graded**Repeatable for additional credit:** Yes
